Engineering Leadership & Talent Acquisition

NexaScale Global Logistics

Application for: Principal Backend Engineer – Distributed Systems

Dear NexaScale Hiring Team,

I am writing to apply for the **Principal Backend Engineer – Distributed Systems** role at NexaScale Global Logistics. With 10 years of experience architecting, operating, and scaling mission-critical distributed systems, asynchronous event pipelines, and high-concurrency database architectures using **C#, .NET 8 / ASP.NET Core, Azure Service Bus, SQL Server**, and **Kubernetes**, I am eager to contribute to NexaScale's next-generation logistics and real-time coordination engine.

Throughout my career, I have specialized in building robust, low-latency backend architectures designed for massive transaction scale and high availability:

- **High-Throughput Distributed Microservices:** Architected RESTful microservices and event-driven backends processing **10M+ monthly transactions** with sub-100ms response times.
- **Asynchronous Messaging & Event Decoupling:** Designed resilient messaging systems utilizing **Azure Service Bus (Queues, Topics, Pub/Sub)** and **Azure Functions**, implementing dead-letter strategies, deduplication, and resilient worker consumers.
- **Database Scalability & Performance Tuning:** Optimized high-concurrency relational queries and execution plans in **SQL Server** (reducing reporting latency by **40%**) and structured MongoDB compound indexing pipelines for messaging services handling **100,000+ monthly SMS events with <80ms response times** (a 50% speedup).
- **Latency & Cost Optimization:** Reduced core API response times by **45%** through caching and asynchronous decoupling, while slashing cloud infrastructure costs by **30%** via Kubernetes workload rightsizing.
- **Reliability & Observability:** Implemented distributed tracing, structured logging, and health probe monitoring in **Application Insights**, maintaining **99.8%+ uptime** across critical service tiers.

As a certified **Azure Solutions Architect Expert (AZ-305)** and **Certified Kubernetes Application Developer (CKAD)**, I have a disciplined background in Domain-Driven Design (DDD), CQRS, Clean Architecture, and zero-downtime migration strategies. I am passionate about mentoring senior engineering staff, authoring Architectural Decision Records (ADRs), and partnering with product stakeholders to maintain delivery momentum without compromising system resilience.

I welcome the opportunity to discuss how my distributed systems expertise and track record of backend scalability can support NexaScale's high-growth logistics platform. Thank you for your time and consideration.

Best regards,

Naveed Ahmed Khan

Principal Backend Engineer – Distributed Systems
